

Problem

Given an acute triangle $\triangle ABC$, construct with straightedge and compass square $DEFG$ such that D and E are on \overline{BC} , G is on \overline{AB} and F is on \overline{AC} .

Straightedge and compass can construct the middle point of a line segment, and perpendicular line through a point on a line segment.

Construction steps are:

1. draw height AH to BC
2. extend BC to J such that $CJ = AH$
3. draw square $CJKI$
4. set intersection of CK and BJ to X
5. draw line pass X and parallel to BC , intersect with AB at G , with AC at F
6. draw perpendicular lines down from G and F to get D and E

To prove $DEFG$ is a square, since $\triangle BCX \sim \triangle BJK$,

$$\frac{CX}{JK} = \frac{BC}{BJ} \quad \text{or} \quad \frac{EF}{AH} = \frac{BC}{BC + AH} \quad \text{or} \quad EF = \frac{BC * AH}{BC + AH} \quad (1)$$

since $\triangle ABC \sim \triangle AGF$,

$$\frac{GF}{BC} = \frac{AL}{AH} = \frac{AH - EF}{AH} \quad (2)$$

Then we just need to verify that $GF = EF$. From (2),

$$\begin{aligned} GF &= BC * \frac{AH - EF}{AH} = \frac{BC}{AH} * (AH - EF) \\ &= \frac{BC}{AH} * \left(AH - \frac{BC * AH}{BC + AH} \right), \quad \text{from(1)} \\ &= \frac{BC}{AH} * \frac{AH^2}{BC + AH} = \frac{BC * AH}{BC + AH} = EF \end{aligned} \quad (3)$$

The construction logic is derived from the GF expression.
